

---

this in Visual Studio 2010. I also tried adding a virtual environment, which was not necessary. I think this is what caused the error. A: I found an interesting article that describes this problem and provides a solution to Installshield 2019. They claim that the problem is caused by non-numeric characters in the project properties or in the names of DLLs referenced by the project. It provides a few steps to correct the problem. In the project properties, click the Installer project node, click Properties in the Properties panel and go to the "Deployment Information" tab. On the "Deployment Information" tab, note the deployment section. In the "Deployment Configuration" list, select "Scripted" and then click the button. In the Name field of the "Deployment Information" tab, add a ".d" to the end of the name of the project, such as InstallShield.dproj. I 2d92ce491b
